

**NAME**

psiconv – Translate Psion 5 and other EPOC device files.

**SYNOPSIS**

**psiconv** [-d|--debug] [-h|--help] [-o|--outputfile] [-s|--silent] [-T|--type=FILETYPE]  
[-V|--version] [-v|--verbose] [-u|--UTF8] [FILE ...]

**DESCRIPTION**

This manual page explains the **psiconv** program. **Psiconv** translates Psion 5 and other EPOC device files to more commonly used formats.

Psiconv works like a filter: output is sent to **stdout** without the *-o* option, and input is read from **stdin** if no files are given.

**OPTIONS**

-d|--debug  
    Show debug information on stderr

-h|--help  
    Display this help and exit

-o|--outputfile  
    Output to file instead of stdout

-s|--silent  
    Do not even show warnings on stderr

-T|--type=FILETYPE  
    Output type

-V|--version  
    Display the program version and exit

-v|--verbose  
    Show progress indicators on stderr

-u|--UTF8  
    Input file is encoded in UTF8

**LICENCE**

Psiconv is released under the Gnu General Public License, version 2 or higher.

**BUGS**

Many more formats should be supported.
